

TINY TUMMY

Business Rules & Operations Protocol

The complete process, A to Z — ordering, procurement, kitchen, quality (ISO 22000), delivery, payables and people

POWERED BY IAN TRADING SAL

Version 1.0 · August 2026 · Confidential

1 · Purpose, scope and principles

This protocol defines how Tiny Tummy runs, end to end: from the moment a parent places an order to the moment the meal is delivered, paid for, and every supplier and employee behind it is settled. It is the single reference for staff, and the Operations Dashboard is its system of record — if the dashboard and a private note disagree, the dashboard wins.

Guiding principles

- **Food safety first.** We cook for babies. Any conflict between speed and safety is resolved for safety, always.
- **One system of record.** Every order, lot, temperature, invoice and complaint lives in the dashboard, never on paper alone.
- **Traceability everywhere.** Every meal can be traced: ingredient lot → batch → order → customer, in both directions.
- **The promise is the deadline.** Order before 3:00 PM → delivered next day (48 h max, Sundays excluded). A promise we cannot keep is communicated before the customer notices, with a new time.
- **Named responsibility.** Every step is signed by a person; every permission is a named key held by named roles.

2 · Roles, permissions and the super admin

Access follows one rule: **one permission key per capability**, granted by role with optional per-person overrides. The database enforces the same keys the screens do.

Role	Holds by default
Super admin (Owner)	Everything, always. May take over any role (act-as) to work exactly as that person; every acted-as action
Manager	Orders, kitchen, inventory, BOM, delivery, suppliers & payables, ISO, complaints, programs, chat, push, support
Kitchen	Kitchen production, inventory & requisitions, chat.
Delivery	Dispatch & agent tools, chat.
Support	Orders, complaints & escalation, chat.

- New capabilities get a **new key** — never reuse a broader one.
- Losing a permission silences everything it fed (screens, notifications) with nothing to clean up.

3 · Sales & ordering — from click to confirmation

Step	Rule	Owner · SLA
Order arrives	Website / WhatsApp order lands as NEW; customer data checked (phone, address, age, suitability of items).	Support 30 min
Confirm	Confirm before the 3:00 PM cutoff for next-day delivery; confirmation push sent to the customer already.	Support same day
Refuse / adjust	Out-of-stock or age-unsuitable items are proposed a substitute before confirming. Support silently swapped.	Support
Age programs	Subscription orders (First Tastes 6–7M · Little Explorers 7–12M · Toddler Table 12–24M · Big Kids Club 2–5Y) auto-	Manager

Margins are computed from the BOM on every order at confirmation; an order that prices below the food-cost target ($\leq 40\%$) is flagged to the manager before it enters the kitchen.

4 · Procurement, suppliers & stock — the auto-receiving rule

The cycle

- **Minimums drive buying.** Every ingredient has a minimum level and a reorder quantity. The moment stock falls below minimum, the system opens an **auto-requisition** — no one has to notice.
- **Invoice = receiving.** Posting a supplier goods invoice IS the stock entry: each line (ingredient, qty, unit cost, lot number, expiry) becomes a stock lot instantly, the ingredient's cost updates to the latest price, and the open requisition closes itself. There is no separate “receiving” step to forget.
- **FEFO always.** Picking follows First-Expired-First-Out. The dashboard shows which lot is next; taking a later lot first requires a reason in chat.
- **No lot number, no entry.** A goods line without lot number and expiry cannot be posted. Unlabeled deliveries are refused at the door.

Payables — suppliers and employees in one book

- Employees are **service providers** in the same payables book: salaries and delivery commissions are posted as service invoices with due dates, exactly like a supplier invoice.
- Every invoice is **paid or unpaid**, with the payment date recorded; unpaid past its due date shows as **OVERDUE** and appears in the Advisor.
- Payment terms live on the provider (e.g. 30 days farm, 15 days dairy, salaries on receipt). Overdue to fresh-produce suppliers is treated as urgent — it costs us first pick of produce.

Provider type	What they invoice	Terms	Stock effect
Supplier — goods	Ingredients with lot + expiry	Per provider (15–30 d)	Auto-received into lots
Supplier — service	Packaging, logistics, maintenance	Per provider	None
Employee	Salary / commission	On receipt	None

5 · Kitchen production — the internal process

Every confirmed order runs the same signed sequence. Sending an order to the kitchen consumes its BOM from stock (FEFO) at that moment; the picked lots are written into the order's history.

#	Step	Rule	Record
1	Prep & wash	Produce washed and prepped; allergen separation enforced.	Signed (who + when)
2	Cook — CCP	Core temperature $\geq 85^{\circ}\text{C}$ measured and recorded. Below limit: re-cook and temperature sign; the step cannot o	Temp + sign
3	Blend / assemble	Texture per age label (smooth 6M+, thicker 7M+, pieces 12M+).	Signed
4	Portioning	Portion weight per product spec. Actual portions and average weight recorded. Portioning sheet	Portioning sheet
5	Blast chill — CCP	$\leq 5^{\circ}\text{C}$ within 90 minutes, measured and recorded; out of limit escalates.	Temp + sign
6	Pack + lot label	Batch lot label printed on the order; allergens on every pack.	Batch lot
7	QC check	Final check: label vs order, seal, weight sample, cold chain. QC pass releases	Signed dispatch.

- Portion size and portions-per-batch are set per product in the BOM screen — the kitchen never guesses.
- An out-of-limit CCP is never overridden by the kitchen alone: corrective action, new measurement, and a manager-visible log entry.

6 · Quality & ISO 22000 governance

- The ISO 22000 checklist in the dashboard (clauses 4–10, PRPs and HACCP) is the working readiness sheet; every item carries a flag (done / in progress / not done), an owner and evidence.
- Weekly: complaints reviewed against lots; monthly: checklist walked top-to-bottom in the management review; the readiness bar is reported to the owner.

- Traceability drill twice a year: pick a delivered order, trace back to every ingredient lot in under 30 minutes; pick a lot, list every affected order.
- Recall: if a lot is suspect, the batch lots that used it identify every affected order; customers are contacted within 24 h; the case is logged as a high-severity complaint with root cause.

The checklist is a working summary in our own words; certification work follows the official standard text.

7 · Dispatch & delivery — tracking, ETA and delays

Event	Rule	Customer notification
Dispatch	QC-passed orders are assigned to an active agent; ETA computed from road distance (city speed 22 km/h × road factor)	From dispatch left the kitchen
On the road	Agent GPS pings move the live map; cold chain in insulated boxes, "arriving soon" zone	Arriving soon
Delay	Agent reports a delay OR the promised time passes undelivered → new ETA is sent	Delay push
Delivered	Agent marks delivered; timestamp closes the order.	Delivered confirmation

- A delivery running late is a communication event first: the customer hears from us before they call us.
- Undeliverable orders return to the kitchen refrigerated and are logged; two failed attempts escalate to support.

8 · Customer care & escalation

Severity	Examples	First response	Resolution SLA	Escalation
High	Safety concern, broken seal, wrong allergen	Within 1 h	24 h	Manager immediately; owner same day; sus
Medium	Late delivery, wrong item	Within 4 h	48 h	Manager if SLA at risk
Low	Preference, packaging feedback	Same day	72 h	Weekly review

- Every case is a numbered file (CASE-xxx) tied to its order, with a full log: opened → investigating → escalated → resolved.
- A case at or past its SLA appears in the Advisor and cannot be closed without a logged resolution.
- High-severity food cases always link the batch lot — this is how a complaint becomes a recall check.

9 · Notifications policy

- **Sent, delivered and opened are three different facts** and are tracked separately in the push log.
- A send with no audience is refused — a notification that silently addresses everybody is treated as a defect.
- Automatic pushes: order confirmed · left the kitchen (with ETA) · arriving soon · delay (new ETA) · delivered · stock below minimum (kitchen) · CCP out of limit (manager) · case escalated (manager).
- Audience targeting: by role, by customer, or by age program. Marketing pushes go only to programs that opted in.

10 · Data, security & audit

- Row-level security in the database asks the same permission keys as the screens — a page gate alone is never a gate.
- Personal data (names, phones, addresses) lives in the database behind those keys, never in public files.
- Super admin act-as sessions, CCP overrides, price changes and payables mark-paid actions are audit events with actor + timestamp.
- Daily automated backup of the database; restore tested quarterly.

11 · KPIs & review cadence

Cadence	Review	Attends
Daily (10 min)	Yesterday's orders, today's kitchen load, overdue invoices, open high cases, Man stock	Manager + chef
Weekly	Margins by product (food cost ≤ 40%), delivery on-time %, complaints by cause, On supplier speed	Owner + manager paid vs outstanding
Monthly	ISO readiness %, program enrollment & churn, payables aging, price list vs last price	Owner + manager + chef

This protocol is versioned. Changes are proposed in the management review, approved by the owner, and republished to the team — the dashboard and this document move together.
